

U1 T6: Practical – UI and UX Comparison Activity

Objective

To understand the difference between User Interface (UI) and User Experience (UX) through observation and comparison

Procedure

Step 1: Select any two mobile applications or websites.

Example:

- Amazon vs Flipkart
- Swiggy vs Zomato
- Gmail vs Outlook

Selected Applications: Amazon and Flipkart

Step 2: Perform the following tasks:

- Open the application
- Search for an item
- Add to cart (or perform a simple task)
- Navigate through menus

Step 3: Observe UI features:

- Colors
- Typography
- Icons
- Buttons
- Layout
- Images

Step 4: Observe UX features:

- Ease of navigation
- Speed of completing the task
- Number of clicks
- User satisfaction
- Error handling

Step 5: Comparison Table

Feature	App A – Amazon	App B – Flipkart
UI Design	Simple and professional	Bright and attractive
Navigation	Easy	Easy
Ease of Use	Very easy	Easy
Visual Appeal	Clean and simple	Attractive and colorful
Overall UX	Excellent	Very good

Expected Outcome

Students will distinguish between UI and UX and evaluate digital products using usability criteria.

Result

Amazon and Flipkart were compared based on their UI and UX features. Both applications provide an easy shopping experience, with differences in their visual design and navigation.

U1 T7: Practical – Design Thinking Stage Mapping

Objective

To understand the five stages of Design Thinking by applying them to a real-world problem.

Problem Statement Example

"Students find it difficult to locate available seats in the college library."

Procedure

Students identify activities under each stage.

Stage	Activity
Empathize	Interview students
Define	Identify the actual problem
Ideate	Generate multiple solutions
Prototype	Draw interface sketches
Test	Collect user

feedback

Activity

Each group prepares a Design Thinking Map on chart paper.

Example

Problem

↓

Empathize

↓

Define

↓

Ideate

Test

↓

Completed Design Thinking Map

Problem:

Students find it difficult to locate available seats in the college library.

Empathize:

Interview students about their difficulties in finding seats.

Define:

Students need an easy way to know which library seats are available.

Ideate:

- Digital seat availability system
- Mobile application
- Digital display
- Online seat map

Prototype:

Draw an interface showing available and occupied seats.

Test:

Show the prototype to students and collect their feedback.

Expected Outcome

Students understand how Design Thinking converts user problems into practical solutions.

Result

The five stages were mapped to the library seat availability problem and a possible user-centered solution was identified.

U1 T8: Practical – Brainstorming and Gamestorming Session

Objective

To generate creative ideas using brainstorming and gamestorming techniques.

Problem Example

"How can the college canteen ordering process be improved?"

Part A – Brainstorming (20 min)

Rules:

- No criticism
- Encourage wild ideas
- One idea per sticky note
- Quantity over quality

Students generate as many ideas as possible.

Examples:

- QR ordering
- Token display
- Online payment
- Digital menu
- Queue monitoring

Additional Ideas Generated

- Pre-ordering system
- Self-service kiosk
- Order tracking
- Digital token system
- Order-ready notification

Part B – Gamestorming (30 min)

Activity:

Crazy 8s

Each student folds an A4 sheet into eight sections.
They draw 8 different interface ideas in 8 minutes.

OR

Dot Voting

Students vote on the top three ideas using colored stickers.

Selected Ideas

- 1. QR ordering**
- 2. Digital menu**
- 3. Online payment**

Expected Outcome

Students practice collaborative ideation techniques and learn how structured creativity improves solution generation.

Result

Brainstorming and Crazy 8s were used to generate different ideas for improving the college canteen ordering process. The best ideas were selected for further development.

U1 T9: Practical – Observational Empathy Exercise

Objective

To understand user behavior through direct observation and identify user needs.

Location

College Library

Procedure

Students observe one user performing a task.

Examples:

- Borrowing a library book
- Ordering food
- Paying fees
- Finding a classroom

Students record observations without interrupting the user.

Task Observed

Borrowing a library book

Observation Sheet

Observation	Notes
User Goal	Find and borrow a required book
Actions	Searches the shelves and checks book labels
Difficulties	Takes time to find the correct section
Confusion	Unsure where

	the required book is
Time Taken	Around 10 minutes
Emotional Response	Slightly confused and frustrated

Empathy Map

THINKS

- “Where can I find this book?”
- “Is this the correct section?”
- “There should be an easier way.”

SAYS

- “Where is this book?”
- “I can't find the section.”

DOES

- Checks different shelves.
- Looks at book labels.
- Asks another student for help.

FEELS

- Confused
- Frustrated
- Impatient

Discussion

What problem did the user face?

The user found it difficult to locate the required book quickly.

What could improve the experience?

A digital book-search system could show the location and shelf number of the book.

Suggest one design solution.

A Library Book Finder App can help students search for books and find their exact shelf location.

Expected Outcome

Students develop empathy by observing real users and identifying usability issues before proposing design improvements.

Result

The observation helped identify the user's difficulties while finding a book and suggested a simple digital solution to improve the library experience.
